Multiple Run Management Enhancements and Iterative mode

RiverWare User Group Meeting
August 13-14, 2008

David Neumann and Heather Pry

Outline

- Background
- Recent Enhancements
- Upcoming Enhancements
- Iterative Mode
- Yield Study Demonstration

MRM Modes

- Two main modes – Concurrent and Iterative
- Concurrent mode is frequently used for policy studies
 - The inputs are known in advance
 - The number of simulations is known in advance
- Iterative mode is used when the number of simulations is determined based on results (more later)

Concurrent MRM

- All simulations have the same start and finish dates
- Define multiple simulation runs by specifying multiple inputs
- Inputs include rulesets, input DMIs and index sequential (rotating time series data)

Concurrent MRM: Simple example

- A policy study might include
 - three rulesets (expressing the proposed policies)
 - five input DMIs (representing the hydrologic scenarios to evaluate the policies)
- RiverWare runs the 15 resulting simulations
- Output is RiverWare Data Format (RDF) file and/or Excel spreadsheet

Recent Enhancements - Output

- Output can be sent to multiple RDFs

Object.Slot: file=name1.rdf file=name2.rdf

- Output at different timesteps. The user specifies:

- Must Match – first slot determines timestep, slots with other timesteps are skipped
- Use Smallest – Uses smallest timestep (e.g. if monthly and yearly data, it uses monthly, the yearly data has 11NaNs)
- Use Largest – Uses largest timestep (e.g. if monthly and yearly data, use yearly, monthly outputs only Dec value)

Recent Enhancements

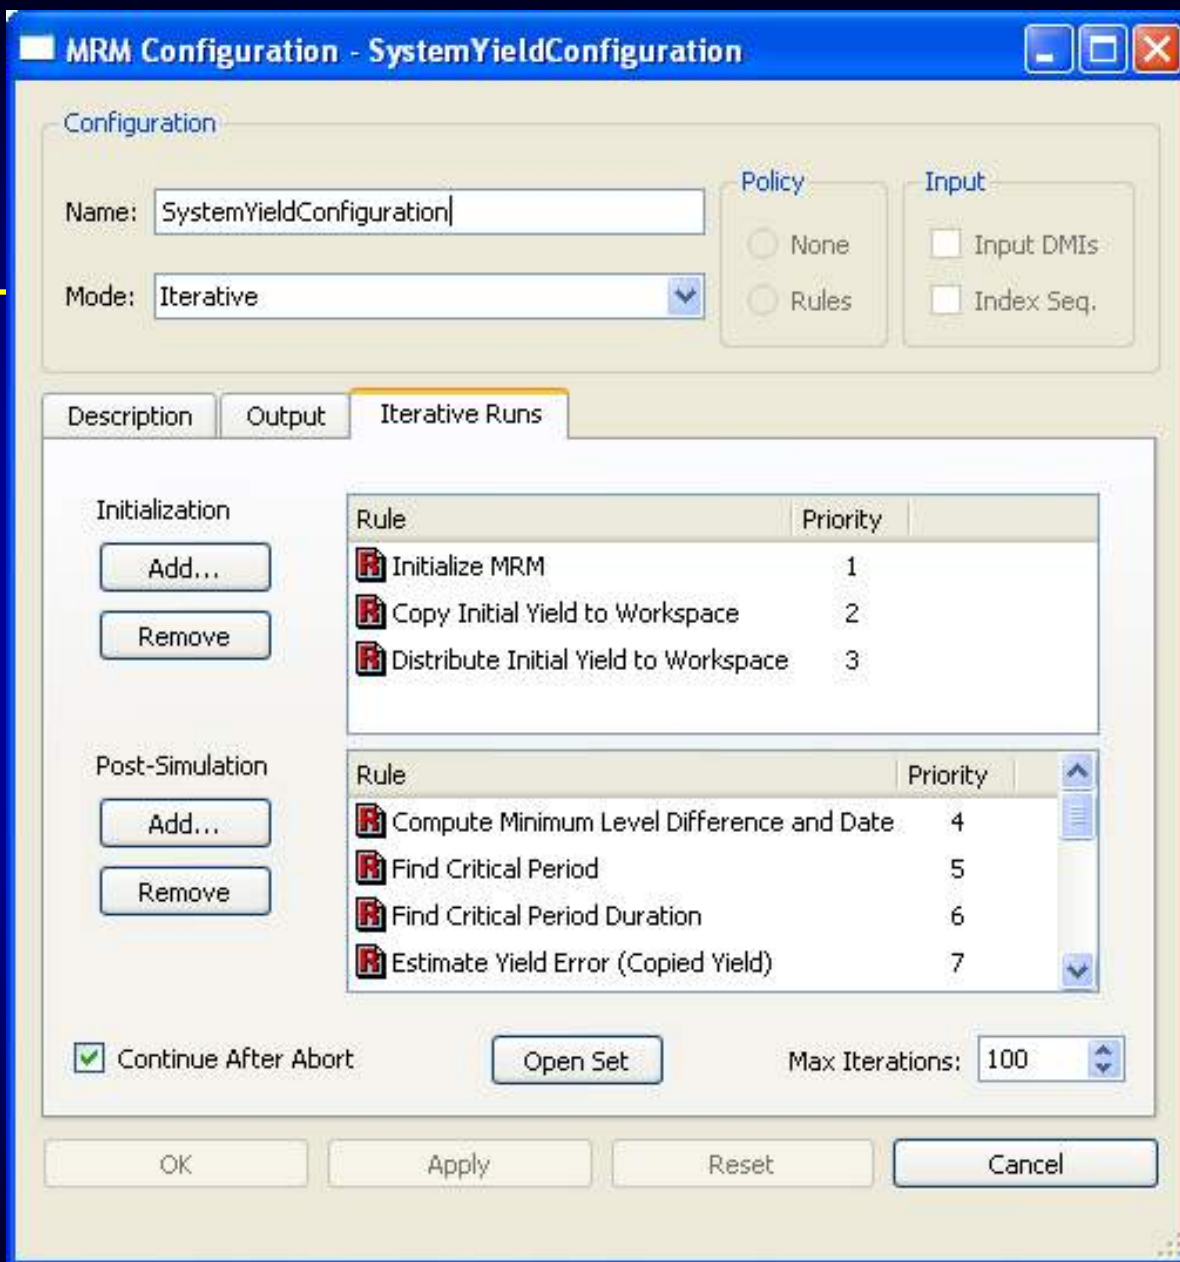

- Account names are now written to RDF and Excel file
- Spaces allowed in File Paths – check box

Upcoming Enhancements

- Better support for long term modeling (paleo, climate change, etc)
 - Upwards of 1000 input DMI's
 - Improve performance of these runs
 - Proposed Approach:
 - Fix memory issues
 - Use multiple machines

Iterative Mode

- The number of simulations is not known in advance – it is determined by the state of the system after each simulation
- User develops rules in the “MRM Ruleset”
- Configure MRM to call these rules at either:
 - Initialization – once at beginning
 - Post-Simulation – after each run
- Another simulation is made if any post-simulation rule changes a value

MRM Configuration - SystemYieldConfiguration

Configuration

Name:

Mode:

Policy: None Rules

Input: Input DMIs Index Seq.

Description Output **Iterative Runs**

Initialization

Add... Remove

Post-Simulation

Continue After Abort Max Iterations:

Rule selector for: MRM Rules

Rule	Priority	On
[-] First Run Set Up		<input checked="" type="checkbox"/>
<input checked="" type="checkbox"/> Initialize MRM	1	<input checked="" type="checkbox"/>
<input checked="" type="checkbox"/> Copy Initial Yield to Workspace	2	<input checked="" type="checkbox"/>
<input checked="" type="checkbox"/> Distribute Initial Yield to Workspace	3	<input checked="" type="checkbox"/>
[-] Previous Run Analysis		<input checked="" type="checkbox"/>
<input type="checkbox"/> Compute Minimum Level Difference and Date	4	<input checked="" type="checkbox"/>
<input type="checkbox"/> Find Critical Period	5	<input checked="" type="checkbox"/>
<input type="checkbox"/> Find Critical Period Duration	6	<input checked="" type="checkbox"/>
<input type="checkbox"/> Estimate Yield Error (Copied Yield)	7	<input checked="" type="checkbox"/>
<input type="checkbox"/> Estimate Yield Error (Distributed Yield)	8	<input checked="" type="checkbox"/>
[+] Next Run Set Up	9-16	<input checked="" type="checkbox"/>

Useful Tools for Iterative Mode

- Integer Indexed Series Slots
- GetRunIndex predefined function
- STOP RUN statement: Stop the iterative run because results have converged

The screenshot shows a software window titled 'Yield Study Data.Yield'. The window has a menu bar with 'File', 'Edit', 'View', 'TimeStep I/O', and 'Adjust'. Below the menu bar, there is a 'Yield' label and a 'Value: 0' input field with a unit of '1000000 m3/year'. A 'Scroll:' dropdown menu is set to 'January, 1920'. The main area contains a table with two columns: 'Pella 1000000 m3/ye:' and 'Madikwe 1000000 m3/ye:'. The table has 22 rows, numbered 1 to 22. The values in the 'Pella' column are mostly 0.143441, with some variations in the first few rows. The values in the 'Madikwe' column start at 0.000000 and increase to 0.251463 by row 22.

	Pella 1000000 m3/ye:	Madikwe 1000000 m3/ye:
1	0.000000	0.000000
2	0.789738	0.000000
3	0.394869	0.000000
4	0.197435	0.000000
5	0.098717	0.000000
6	0.148076	0.000000
7	0.123397	0.000000
8	0.135736	0.000000
9	0.141906	0.000000
10	0.144991	0.000000
11	0.143449	0.000000
12	0.144220	0.000000
13	0.143441	0.000000
14	0.143441	0.000000
15	0.143441	2.926119
16	0.143441	1.463060
17	0.143441	0.731530
18	0.143441	0.365765
19	0.143441	0.182882
20	0.143441	0.274324
21	0.143441	0.228603
22	0.143441	0.251463

Iterative MRM – Execution Order

- An iterative run executes as follows:
 - Initialize the iteration count.
 - Execute the initialization rule(s), if specified.
 - Perform the simulation run.
 - Execute the post-simulation rule(s), if specified.
 - If the post-simulation rule(s) return “no change”, that is they do not assign one or more new (different) values, the iteration is complete.
 - Otherwise, the iteration count is checked. If it equals the maximum number of iterations specified, then the iteration is complete also.
 - If the iteration is not complete, then increment the iteration count and make another run.

Yield Study using Iterative MRM

➤ Purpose:

Republic of South Africa Department of Water Affairs and Forestry Modeling Workshop, May 2008, Case Study

➤ Approach:

- Yield – Diversion that exactly draws down reservoir to minimum level
- System Yield – Find yield of upstream reservoirs, use this yield when determining yield of downstream reservoirs

➤ Demonstration
