

APPLICATION OF FLOOD CONTROL IN THE ARKANSAS RIVER BASIN

**US Army Corps
of Engineers**
Tulsa District

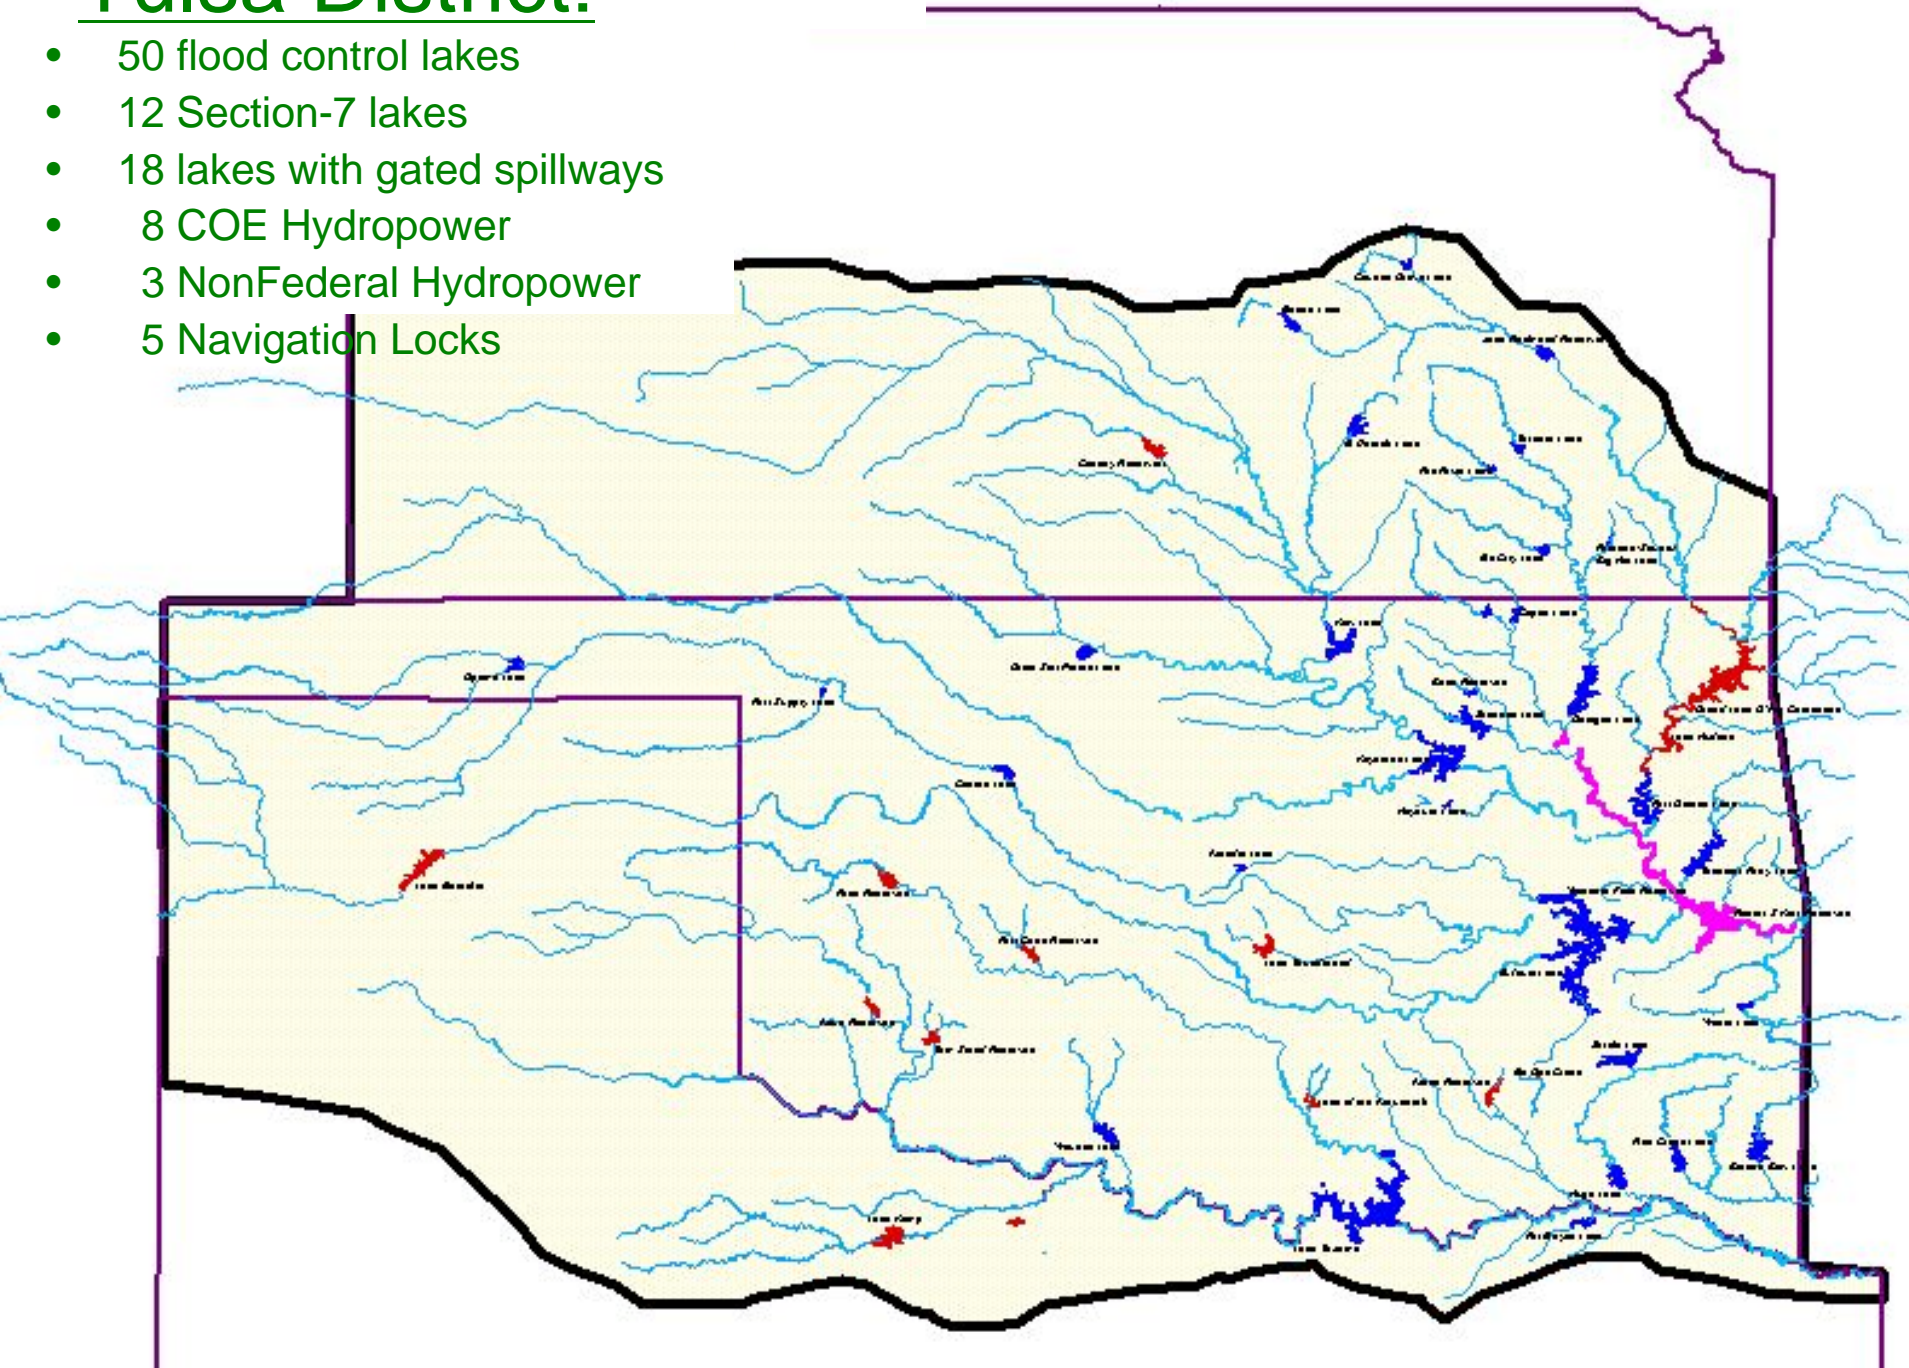

TODAY'S DISCUSSION

- System/Project Features
- Flood Control Operation
- Need for Period Of Record (POR)
Basin Simulation Model
- Transition to RiverWare

Tulsa District:

- 50 flood control lakes
- 12 Section-7 lakes
- 18 lakes with gated spillways
- 8 COE Hydropower
- 3 NonFederal Hydropower
- 5 Navigation Locks

Tulsa District Corps System Project Purposes

- 35 Projects in Arkansas Basin & 15 Projects on Red River Basin
- Flood Control
- Hydropower
- Low Flow/WQ
- M&I
- Navigation
- Recreation
- Levees

PROJECT COMPONENTS

- Low Flow Conduit
- Hydropower
- Radial Arm (Tainter) Gates
- Gated Sluice Gates
- Gated Conduit Through Embankment
- Uncontrolled Conduit
- High Level Uncontrolled Spillway
- Combinations of Control

STORAGE DIVISIONS

ORIGIN OF INFLOW

- Seasonal Rainfall - Spring/Fall
- Frontal Systems
- Remnants of Tropical Systems
- Snow Pack/Melt Insignificant

RUNOFF RESPONSE TIME

- Few Hours to Several Days
- Single to Multi-Day Event
- Evacuate Flood Control Storage Prior to Next Event, If Possible

Frequency of Filling

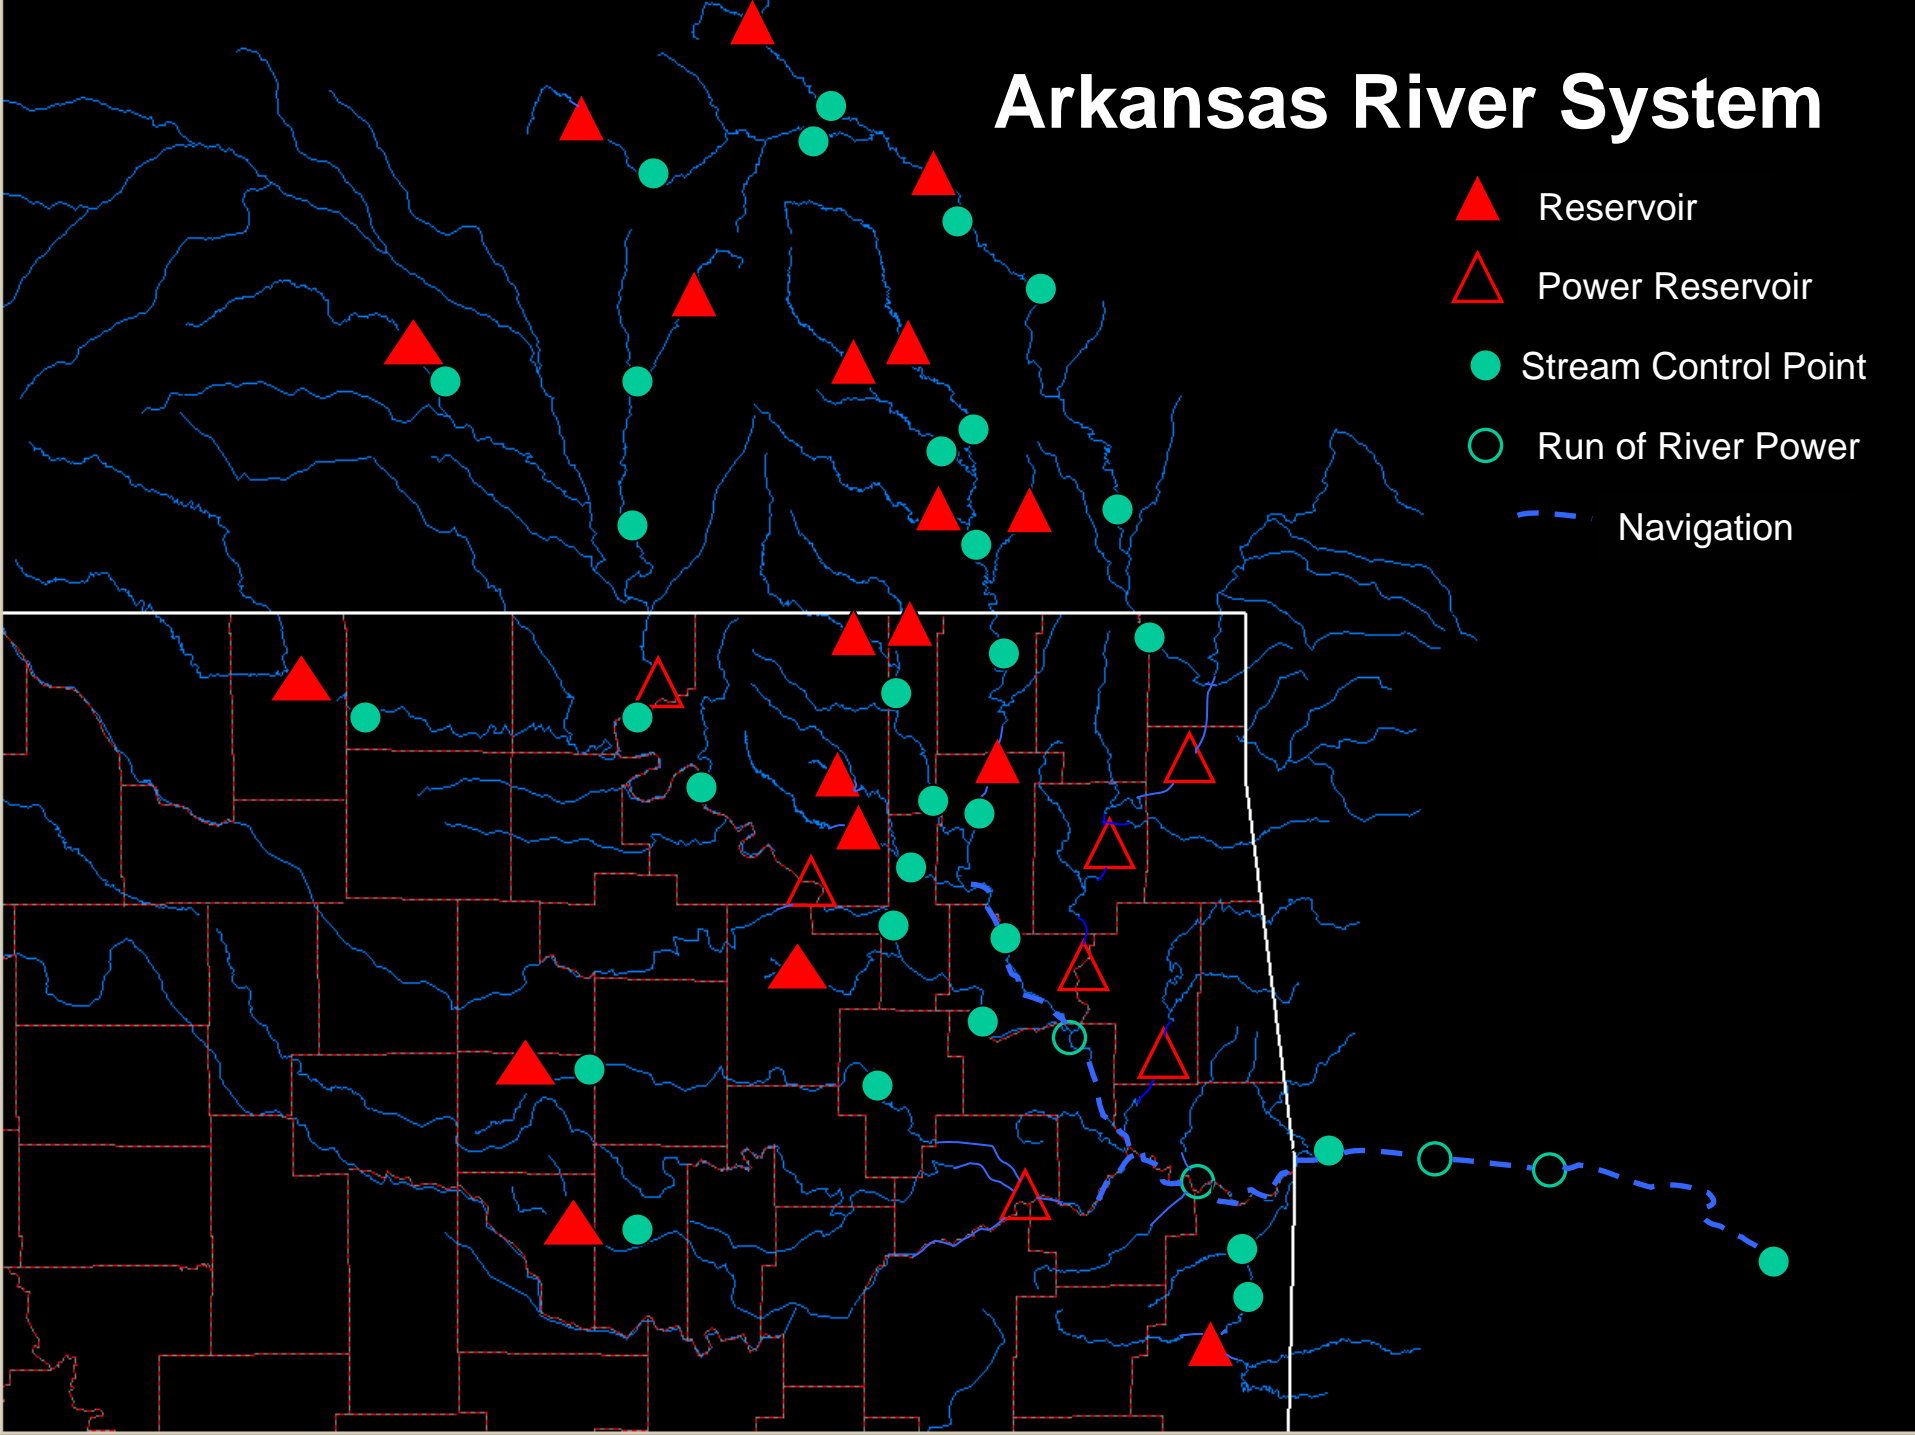

■ 100% full ■ 95% full

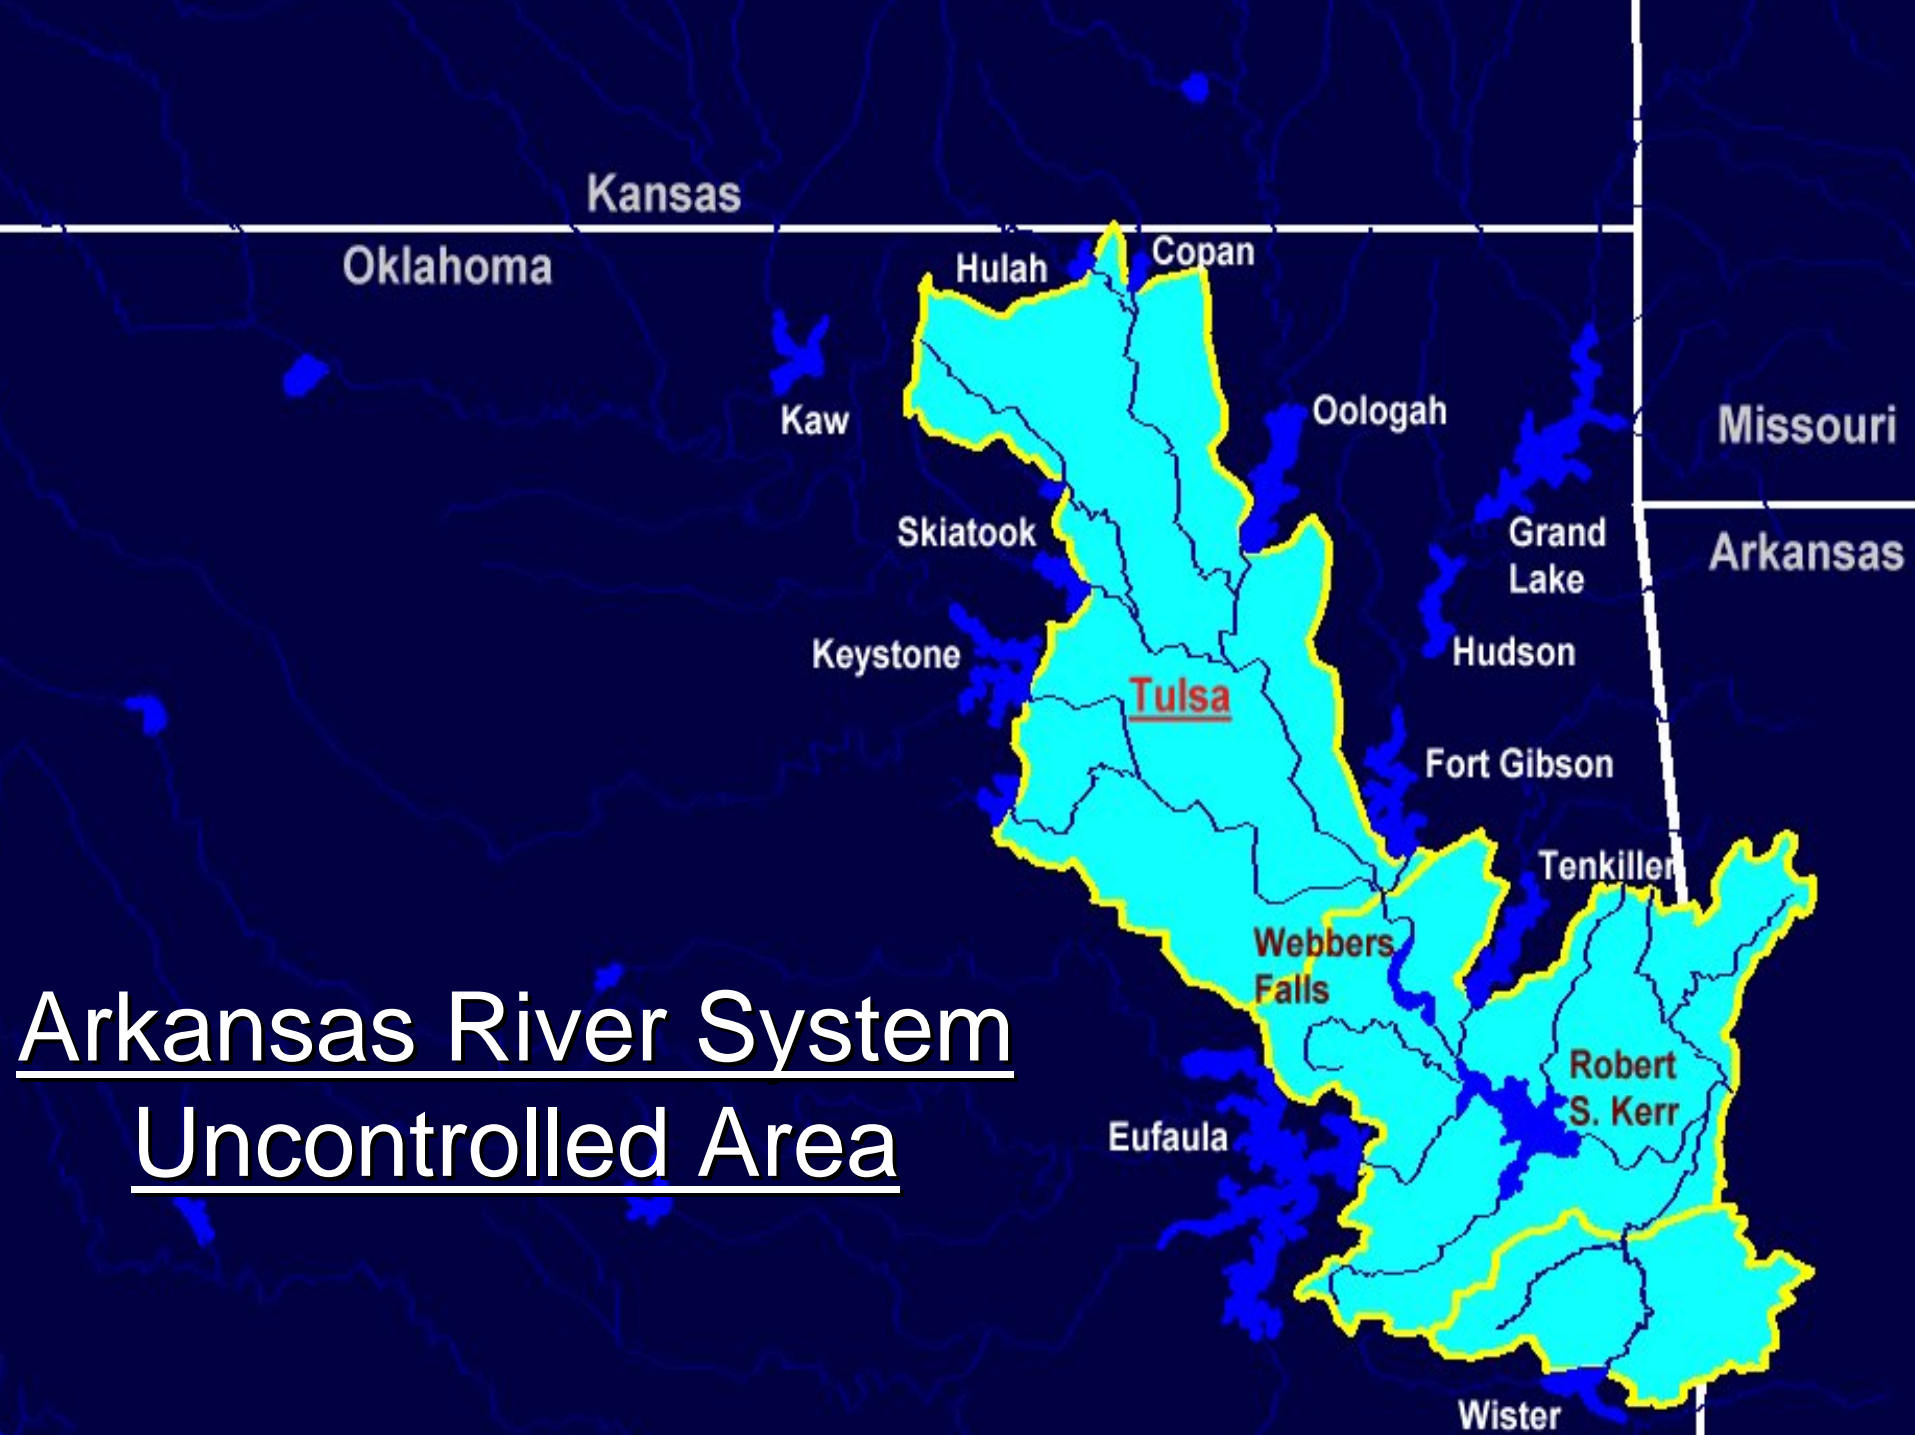

GOAL OF FLOOD CONTROL OPERATION

- Prevent overtopping: loss of control.
- Releases from the lake, when combined with downstream runoff will not cause flooding conditions, if possible.
- System balancing of flood control storage & evacuation.
- Flood waters will be stored to prevent downstream flooding and evacuated prior to next flood event, if possible.

Arkansas River System

TULSA DISTRICT WATER CONTROL PROGRAMS

- **Real-Time Water Control:**
Data Collection/Processing
Current “State of the System” - Numerous Utility Programs
Web Site
Inflow Forecast
- **Stage Reduction & Benefit Analysis**
- **Annual Water Control Reports**
- **Planning Investigations/Alternative Operations –
POR Basin Simulation & Planning Model**
(Not Real-Time)

NEED FOR POR SIMULATION & PLANNING MODEL

- Period of Record Statistical Analysis
- Alternative operational approaches
- Reallocation of authorized storages
- Recreation Investment
- M&I Dependability
- Hydropower
- Navigation
- Environmental Issues

EXISTING POR SIMULATION & PLANNING MODEL

- Southwest Division and subordinate Districts have been using a system planning model for 30 years - “Super”. Development/Expert (Ronald L. Hula) SWD Corps, Retired.
- “Super Program” application has been accepted by SWPA/DOE, State Water Distr’s, navigation, others.
- Districts have limited ability to use/revise program.
- Retiree is temporarily on contract.

BASIN SIMULATION & PLANNING

MODEL with RIVERWARE

- 1999 - Southwest Division Lead Effort to Investigate Existing Simulation Models.
- 1999 - 2000: Determination That Riverware Has Potential to Meet SWD Corps Needs. Simulation and Rules Training.
- CADSWES Incorporating Super Flood Control Logic into RiverWare – Nearly complete with ongoing testing & verification.
- Currently Using Super Program with Assistance of Retiree. Migration to RiverWare....

GENERAL METHODOLOGY TO SIMULATION

- Period of Record Simulation (61 Years, Daily time steps) of Local Flow and Project Operation Based on Predefined Constraints.
- Local Flow Developed From Historic Gage Data and Project Releases.
- On Any Given Day of Simulation, Know Current State of the System with 1-3 Days “Perfect Knowledge” of Inflow and Downstream Local Flow.
- Releases Are Made to Evacuate Flood Control Storage to Achieve a “Balance” in the System. Balance Level, Not Necessarily %
- System Balancing Extended to Conservation Storage.
- Ten Day Decision Plan.

Flood Control Evacuation Plan for Downstream Control Point

SIMULATION WITH RIVERWARE:

- Pre-Defined Rules of Operation/Simulation.
- Reservoir Object: Balance Level Definition
- Control Point Object: Local Flow With Forecast, Channel Control, List of Regulating Reservoirs.
- Key Control Point Definition.
- Stream Routing.
- Evacuate Flood Control Storage In A Way To Achieve System Balance.

CORPS USE WITH RIVERWARE

- Replace Period of Record “Super” Program Used By Tulsa, Ft Worth, & Little Rock Corps Distr’s.
- HEC’s CWMS Programs.
- Real Time Evacuation of Flood Storage - TAPER program used in Tulsa.
- Other Corps Districts?

FUTURE WORK WITH CADSWES

- Critical Dependable M&I Yield Routine.
- Conditional Probability Routine.
- Constant Leakage.
- Multi-Year Periodic Slot: Regulation Guide.
- RiverWare Interaction with HEC's CWMS.
- Corps Hydropower Assessment.
- Statistical Analysis.
- User's Guide: Corps Super Algorithm.
