

US Army Corps
of Engineers

USACE – SWF Initiatives and Model Results

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

Modeling Requirements

- Reallocation studies
- Changes in operation to accommodate:
 - Flooding issues
 - Recreation interests
 - Users with conflicting needs
 - Environmental needs
- Risk assessments
- Evaluate litigant claims
- What if scenarios
 - Flooding
 - Drought

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

Reservoir System Simulation Considerations

- System of reservoirs
- Period of record simulations (historical data)
- Simulations using modified operating parameters
- Simulations in which:
 - Controlled and balanced evacuation of flood water
 - Maximize flow at control points
 - Accommodate mandatory releases
 - Accommodate low flow requirements
 - Accommodate conservation operations requirements
 - Accommodate hydropower requirements
- Operational models

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

System Simulation Components

- Pre-processing of model inputs
- Flood control operation analysis
- Conservation operations analysis
- Hydropower operations analysis
- Hydrologic forecasting
- Post-processing
 - Statistical analysis
 - Economic analysis

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

Scope of Work *(Starting FY2001)*

- Flood control
 - Develop control point objects & workspace flood control configuration
 - Add operating level data to reservoirs
 - Add mandatory release methods to reservoirs
 - Add forecasted hydrology methods to reservoirs, reaches & control points
 - Develop regulation discharge & space hydrograph methods on control point objects
 - Developed flood release dispatch method slots
 - Computational sub-basin object
 - Flood control algorithm testing & documentation

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

Scope of Work

- Conservation operations
 - Multi-year periodic slot
 - Algorithm to calculate reservoir releases for downstream demands
 - Critical dependable yield (controlled multiple runs)
 - Joint with USBR
 - Transit losses (SWD technique)

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

Scope of Work

- Miscellaneous enhancements
 - Hydropower methods
 - Integration into CWMS
 - Joint with HEC
 - Integrated DSS DMI
 - Joint with USBR
 - Conditional probabilities
 - Post-processing statistical methods
 - Usability features
 - Performance tuning
 - Joint with USBR
 - Integration testing & documentation

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

Scope of Work

- Joint SPA/USBR Enhancements
 - Groundwater/surface water interaction
 - Dynamic interface between MODFLOW & RiverWare
 - URGWOM modeling

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

Scope of Work

- In progress enhancements
 - Runtime performance enhancements
 - Additional statistical methods
 - Probability scale for plotting
 - Hydropower enhancements
 - RPL enhancements
 - DMI enhancements
 - Saved exportable/importable plot configurations
 - Integration into CWMS with CWMS 2.0 release
 - Joint with HEC
 - Operational model integration similar to RESIM

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

Future Enhancements

- Water accounting capabilities (WAM)
- Training class for SWD methods/enhancements
- GIS capabilities
- Further performance tuning (decrease run times)

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

Partnership with Corps of Engineers

- In June 08 COE accepted as a RiverWare partner based on total contributions
- Like USBR & TVA, cost-free licenses
- Should result in increased usage across the COE

————— *One Corps Serving The Army and the Nation* —————

US Army Corps
of Engineers

SWF - Rules and Methods

- Rules

- Mandatory Surcharge Release
- Regulation Discharge
- Flood Control
- Low Flow Releases
- Diversions
- Hydropower

- Methods

- Flat Top Surcharge
- Operating Level Balance
- Operating Level-Based
- Key Control Point Balance Levels
- Meet Hydropower Load
- Seasonal Load and Seasonal Load Time

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

SWF - Rules and Methods

- Surcharge Release
 - The rule sets a (S) flag on the Outflow slot
 - Based off of storage and inflows
 - Finds a minimum mandatory release from induced surcharge curves
 - Finds a maximum mandatory release from free-flow curves
 - Min and Max releases are then used to bracket the surcharge release
 - The surcharge release is computed to “flat top” the incoming flood
- Regulation Discharge
 - The rule set a (G) flag on the Reg Discharge Calculation slot.
 - Calculates the maximum flow that is allowed in the channel at a control point
 - These values a fundamental to determining flood control releases
 - Channel Regulation, Res Current or Future Level Regulation, or Reservoir System Percent Full Regulation

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

SWF - Rules and Methods

- Flood Control

- The rule coupled with the method Operating Level Balancing attempts to balance a system of reservoirs by reducing their flood storage from fullest to least full reservoir.
- It cannot cause flooding at a downstream control point
- Water is not released from Conservation Pool
- Priority is given to reservoirs based on operating levels
- Flood pools are drained as soon as possible and within a forecasted period
- Reservoir are given a smooth release schedule

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

SWF - Rules and Methods

- Meet Low Flow Requirements
 - Uses the predefined function MeetLowFlowRequirement.
 - This function computes the necessary Low Flow Release from contributing reservoirs to meet the low flow requirement as a control point
 - This is executed after the Flood Control Rule so as to add any additional release that may be needed
- Diversions
 - Uses the predefined function ComputeReservoirDiversion
 - Used to meet multiple water user demands using multiple reservoirs

One Corps Serving The Army and the Nation

US Army Corps
of Engineers

SWF - Rules and Methods

- Hydropower
 - Uses the predefined function HyrdopowerRelease
 - This is used to determine the maximum proposes power release.
 - This rule executes the Meet Hydropower Load method
 - This method then determines the additional outflow need to meet the required load, or
