

# **Flexible Modeling for Future Reliability**

**Zone 7's Water Supply Portfolio Model**

# Agenda

- Zone 7 Water Agency
- Challenges for Zone 7 and other California water agencies
- Zone 7's RiverWare model
- Flexible prioritization framework
- Hydrologic risk representation
- From Modeling to decision support
- Takeaways and future applications

# Zone 7 Water Agency

- Northern California wholesale water supplier
- 90% of supply is imported from the Sacramento-San Joaquin River Delta via State Water Project (SWP)

# Challenges for Zone 7 & Other California Water Agencies

- Reliability of SWP
- Regulatory constraints
- Climate impacts to water supply & demands
- Development and increasing demands

***Increasing water supply uncertainty;  
Potential future dry-year supply shortages***

Source: DWR 2025 DRAFT Delivery Capability Report. Median, Drier, and Driest correspond to the 50%, 75%, and 95% Level of Concern scenarios published by DWR.

**Planning  
Questions and  
Motivations**

*What new supply investments provide the greatest benefit?  
Representing and planning for future uncertainty  
Communication of results to management and decision-makers*

# Zone 7's RiverWare Model

## Modeling Objectives

*Capital investment planning / portfolio evaluation*  
*Operational strategy testing*  
*Adaptable to changing assumptions / conditions*

- Monthly timestep
- Historical hydrology 1922-2015
  - SWP availability
  - Local supplies: Gauge data, groundwater modeling
- Representation of existing and planned facilities
  - Surface water treatment plants
  - Well fields
  - Local surface water storage
  - Regional groundwater banks

*Many combinations of different projects and operating rules*

# Flexible Prioritization Framework

## Planning Need

- Portfolio and operating priorities change between planning scenarios

## Model Implementation

- Configurable supply and storage prioritization tables
- Operational logic separated from scenario assumptions

## Benefits

- Faster testing of alternative portfolios without repeatedly rewriting rules

**Model Input Tables Controlling Supply Prioritization and Storage Preferences**

# Addressing Hydrologic Uncertainty

## Use of Consistent Industry Datasets

- DWR planning outputs and local supply information
- Climate change data developed specific to SWP and local watershed

## Preserves the conditions that drive risk

- Hydrologic persistence
- Multiyear drought sequences
- Storage depletion and recovery

## Planning benefit

- Defensible comparisons of reliability and capital investments
- Evaluation of probabilistic output that directly addresses agency's Reliability Policy

*Example of ISM Methodology*

| Model Year | 2023 | 2024 | 2025 | → | 2081 |
|------------|------|------|------|---|------|
| Trace 1    | 1922 | 1923 | 1924 | → | 1980 |
| Trace 2    | 1923 | 1924 | 1925 | → | 1981 |
| Trace 3    | 1924 | 1925 | 1926 | → | 1982 |
| ↓          | ↓    | ↓    | ↓    | → |      |
| Trace 93   | 2015 | 1922 | 1923 | → | 1979 |

Example drought, shifts with timeseries

# From Modeling to Decision Support

## How the model informs decisions

- Reliability metric generation
- Power BI visualization platform
- Comparing portfolios and communicating results to decision makers

Table 7-11 Five Consecutive Dry Years Supply and Demand Comparison (DWR Table 7-4)

|             |                     | 2030   | 2035    | 2040    | 2045    | 2050 (Opt) |
|-------------|---------------------|--------|---------|---------|---------|------------|
| First year  | Supply totals       | 72,600 | 89,500  | 94,500  | 90,500  | 90,500     |
|             | Use totals          | 44,500 | 47,300  | 49,300  | 51,100  | 51,000     |
|             | Surplus/(shortfall) | 28,100 | 42,200  | 45,200  | 39,400  | 39,500     |
| Second year | Supply totals       | 69,400 | 92,800  | 95,800  | 90,300  | 90,400     |
|             | Use totals          | 45,000 | 47,700  | 49,600  | 51,000  | 51,000     |
|             | Surplus/(shortfall) | 24,400 | 45,100  | 46,200  | 39,300  | 39,400     |
| Third year  | Supply totals       | 93,900 | 111,800 | 113,300 | 106,900 | 82,000     |
|             | Use totals          | 45,600 | 48,100  | 50,000  | 51,000  | 51,000     |
|             | Surplus/(shortfall) | 48,300 | 63,700  | 63,300  | 55,900  | 31,000     |
| Fourth year | Supply totals       | 57,900 | 65,900  | 65,500  | 58,600  | 58,600     |
|             | Use totals          | 46,200 | 48,500  | 50,400  | 51,000  | 51,000     |
|             | Surplus/(shortfall) | 11,700 | 17,400  | 15,100  | 7,600   | 7,600      |
| Fifth year  | Supply totals       | 58,900 | 57,900  | 50,700  | 44,100  | 40,700     |
|             | Use totals          | 46,700 | 48,900  | 50,700  | 51,000  | 51,000     |
|             | Surplus/(shortfall) | 12,200 | 9,000   | 0       | (6,900) | (10,300)   |

NOTES:

(a) Volumes are in units of AF and are rounded to the nearest hundred.

**Example:** Model supported Z7's water supply reliability forecast for 2025 UWMP.

# Key Takeaways and Future Applications

- RiveWare is a key part of a larger decision support framework that guides:
  - Supply diversification strategies
  - System operations optimization
  - Capital investment planning
- Ultimately supports actionable insights for water management in an increasingly uncertain future
